NOMENCLATURE

Introduction

Saran water-cooled chillers are the premium solution for commercial and industrial applications where installers, consultants and building owner require optimal performances and maximum quality. Saran water-cooled chillers are available in the capacity range of 5 to 720 tons of refrigeration in one to four independent refrigerant circuits (For capacities upper than 560 TR please send your inquiry to Saran MFG group). All components of Saran water-cooled chillers selected from reliable and famous international brands or designed and constructed base on international air-conditioning equipment's standards.

Main Features

Compressor

Saran water-cooled chillers available with screw, reciprocating or scroll type compressor, so these units not only cover wide range of cooling capacities and applications, but also can achieved special features base on selected compressor.

Evaporator

The evaporators of all units are designed and constructed base on the TEMA and ASME-Section VII code, respectively. The enhanced surface tubes use in all shell and tube evaporator to achieve much more compact and efficient units.

Condenser

The condenser is a cleanable thru-tube type with steel shell, copper tubes, removable water heads, and includes integral sub cooling. The shell will be constructed and tested in accordance with section VII of the ASME pressure-vessel code. The condenser is equipped with relief valves and sized sufficiently to hold the total refrigerant charge on pump down operation.

Refrigerant

Saran water-cooled chillers can be design to operate with R-22, R-407C and R-134a refrigerants, in one to four independent refrigerant circuits.

Safety Protection

For more efficiency and safe operation of the units, Saran water-cooled chillers equipped with various safety and operating controls such as, high and low pressure cutout, oil level control, water anti freeze thermostat, water flow switch, evaporator entering water thermostat, compressor operation time logger, three phase controller, circuit breakers and fault detection system. (Microprocessor based PLC controller is also available upon request). All above-mentioned equipment selected from the most recognized controls manufactures in the air conditioning industry.

Selection Information

General

Cooling capacity of Saran water-cooled chiller models presented in the "Performance Data" tables; cover the most frequently encountered leaving water temperatures.

The water-cooled chillers are rated over a range of evaporator leaving water temperatures of 42°F to 46°F and condenser leaving water temperatures of 85°F to 105°F.

To select a Saran water-cooled chiller, the following information is required:

- 1- Design system load (Btu/h)
- 2- Design evaporator leaving water temperature (°F)
- 3- Design evaporator water range (°F)
- 4- Design condenser leaving water temperature (°F)
- 5- Design condenser water range (°F)
- 6- Evaporator fouling factor (h.ft².°F /Btu)
- 7- Condenser fouling factor (h.ft².°F /Btu)

Chilled Water Flow and Range:

Required cooling capacity and the desired chilled water range are two important factors in determining the amount of water to be circulate in the evaporator. The following formula used for determining chilled water flow:

$$\text{Evaporator Water Flow (GPM)} = \frac{24 \times \text{Cooling Capacity (TR)}}{\text{Evaporator Water Range (°F)}}$$

Also, the amount of water to be circulate in the condenser can be determine with following formula:

$$\text{Condenser Water Flow (GPM)} = \frac{24 \times \text{Condenser Total Heat Rejection (TR)}}{\text{Condenser Water Range (°F)}}$$

Performance tables in this catalogue are based on a 10°F temperature drop through the evaporator and condenser. In other conditions please using following correction factors for performance data:

Table 1: Chilled Water Range Correction Factors

	Water Range (°F)	Capacity Multiplier	Power Multiplier
Evaporator	6	0.992	0.995
	8	0.995	0.997
	10	1.000	1.000
	12	1.005	1.002
	14	1.010	1.005
	16	1.014	1.007
Condenser	6	1.003	0.997
	8	1.002	0.999
	10	1.000	1
	12	0.984	1.012
	14	0.976	1.029
	16	0.968	1.052

Fouling factor

The cooling capacity of the water-cooled chillers in this catalogue permit a fouling factor of 0.0001 h.ft².°F/Btu for evaporator and 0.00025 h.ft².°F/Btu for condenser (ARI Standard 550/590-98). In other conditions please using following correction factors for performance data:

Table 2: Fouling Factor Correction Factors

	Fouling factor (h.ft ² .°F /Btu)	Capacity Multiplier	Power Multiplier
Evaporator	0.00010	1.000	1.000
	0.00025	0.992	0.997
	0.00050	0.978	0.990
	0.00075	0.965	0.984
	0.00100	0.951	0.978
Condenser	0.00025	1.000	1.000
	0.00050	0.987	1.021
	0.00075	0.980	1.038
	0.00100	0.965	1.064
	0.00200	0.910	1.092

Condenser Head Pressure Control

For proper operation of a water-cooled chiller, it is necessary to maintain a condenser leaving water temperature upper than 85°F. As a result, a method of condenser head pressure control, including cooling tower fan controlling via thermostat or condenser water flow control via a water-regulating valve shall be employed in cases where the condenser leaving water temperature can drop to lower than 85°F.

Standard condition

Saran water-cooled chiller rating data presented in the "Performance Data" tables indicate capacity of the chiller at the following condition:

- Evaporator and condenser water range: 10°F
- Condenser leaving water temperature: 95°F
- Evaporator fouling factor: 0.0001 h.ft².°F/Btu
- Condenser fouling factor: 0.00025 h.ft².°F/Btu

For other condition, performance adjustment factors shall be attend in unit selection base on following formula:

Actual cooling capacity (MBH) = C1 x C2 x C3 x C4 x C5 x QE;

Actual compressor power input (kW) = C1 x C2 x C3 x C4 x C5 x WC;

Actual condenser total heat rejection (MBH) = C5 x QC;

- QE: Cooling capacity in performance data tables (Table - 4,6,8)
- WC: Compressor power input in performance data tables (Table - 4,6,8)
- THR: Condenser total heat rejection in performance data tables (Table - 4,6,8)
- C1: Evaporator water range correction factor (Table-1)
- C2: Condenser water range correction factor (Table-1)
- C3: Evaporator fouling factor correction factor (Table-2)
- C4: Condenser fouling factor correction factor (Table-2)
- C5: Condenser leaving water temperature correction factor (Table-5,7,9)

Selection Example

Given:

Chilled Water Flow Rate = 450 GPM

Evaporator and condenser water range = 10°F

Evaporator leaving water temperature = 44°F

Condenser leaving water temperature = 105°F

Evaporator fouling factor = 0.0001 h.ft².°F/Btu

Condenser fouling factor = 0.00025 h.ft².°F/Btu

Refrigerant = R22

Compressor type = Screw

Solution:

Step 1: Cooling capacity calculation

To calculate the required cooling capacity we use the following formula:

Cooling Capacity (TR) = Chilled Water Flow (GPM) x Chilled Water Range (°F) / 24;

So in this problem, our required cooling capacity is 187.5 TR (2250 MBH);

Step 2: Water-cooled chiller model selection

By referring to the performance data table of water-cooled chiller (Screw – R22), we can see cooling capacity of 2SRLCS-250W in evaporator / condenser leaving water temperature of 44°F / 95°F is 2425MBH. So we select this unit in first step and in the next step, we will check its final performance in the given condition.

Step 3: Calculating selected unit real capacity in the given condition

By referring to correction factor table of water-cooled chiller (Screw – R22), we can see performance correction factor of selected unit for cooling capacity, compressor power input and condenser total heat rejection in condenser leaving water temperature of 105°F is 0.9289, 1.1008 and 0.9586, respectively. So we have

Cooling capacity = 2425 * 0.9289 = 2252.6 MBH

Compressor power input = 164.5 * 1.1008 = 181.1 kW

Condenser total heat rejection = 2930 * 0.9586 = 2808.7 MBH

So cooling capacity of 2SRLCS-250W satisfy our requirements and our selection in previous step is correct.

Step 4: Condenser Water Flow Calculation

To calculate the condenser water flow rate, we can use the following formula:

$$\text{Condenser Water Flow (GPM)} = \frac{24 \times \text{Condenser Total Heat Rejection (TR)}}{\text{Condenser Water Range (°F)}}$$

So in this problem, the amount of water to be circulate in the condenser is 561.7 GPM.

Step 5: Evaporator and Condenser Pressure Drop

To estimate pressure drop of selected water-cooled chiller, by referring to 2SRLCS-250W pressure drop graph, we can see evaporator and condenser pressure drop of selected unit is 32.8 and 6.1 foot of water respectively.

Electrical Data

Electrical Schematic Curve at the Start-Up

NOTE

- The transient stage is drastically reduced in chillers that utilize unloaders or part winding start method so its curve differs from the above.

Locked Rotor Amps (LRA):

Peak of transient electrical current at the instant of compressor motor start-up. (stage 1).

Maximum Operating Current (MOC):

Maximum electrical current tolerable by compressor motor. This current exists only when the system has been idle (warm evaporator, condenser & connecting piping) & lasts for a short period until the system reaches the steady state condition.

Otherwise the stage 2 of transient state on the graph can be ignored.

Full Load Amps (FLA):

Maximum electrical current drawn at the most undesirable system working condition under steady state operation.

Rated Load Amps (RLA):

Nominal electrical current drawn at normal working condition under steady state operation.

- FLA: Full Load Ampere
- MOC: Maximum Operating Current
- LRA: Lock Rotor Ampere
- MPI: Maximum Power Input (kW)
- D.O.L: Direct Online Start Type
- PW: Part Winding Start Type
- Cable size are based on copper conductor at maximum ambient temperature of 40°C and maximum distance of 70 meter.
- Starting type of compressors maybe change based on the unit operation condition
- All above data subject to change without notice.

Typical Piping Diagram

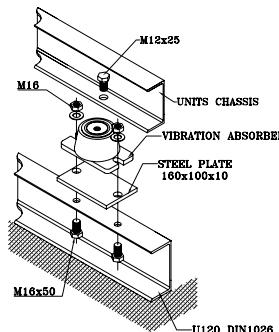

Installation Recommendation

- 1) The unit should be installed on concrete or steel structure bearing platform that is firm and the surface of the baring platform should be smooth and flat. The intensity of the platform should hold the whole unit, if the intensity is not strong enough, it is easy to cause vibration and noise.
- 2) The surface of the concrete base platform normally has been plastered as horizontal ornament with waterproof treatment. the surrounding of it should have drainage sink placed, and the slope angle should be no less than 0.5% and the slope should lead to drainage outlet.
- 3) In order to maintain quiet operation and prevent the vibration and noise transmission from interfering the under floors, the absorber should be laid between the unit base and base platform. Please maintain horizontal when install the unit and mount anti vibration pad when it is necessary.
- 4) In order to keep connection pipe from being twisted to crack by earthquake, typhoon, or by long time running caused movement. The fixation method should be taken into consideration, refers to following examples for platform installation and fixation:

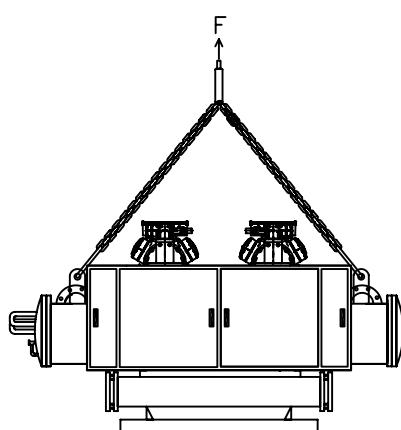

ARMOURED CEMENT FOUNDATION

STEEL FRAME FOUNDATION

Hanging and Transporting of the Unit

- 1) Each unit has been carefully tested and inspected at the factory where every precaution was taken to ensure that it reaches its destination in prefect condition. It is very important that the installers, movers, and riggers use the same care in handling the unit. Chains, cables, or other moving equipment should be placed to avoid damage to any part of the unit. For proper method of rigging consult the label on the unit
- 2) To prevent any damage to the unit, at least 45 degree angle between the unit and the hosting chain and the unit should be maintained.
